

Capstone Project				
Assignment 1(LinuxOS)	Assignment 2(LinuxOS)	Assignment 3(LSP)	Assignment 4(LSP)	Assignment 5(LinuxOS and LSP)
<b>File Explorer Application</b>  <b>Objective:</b> Develop a console-based file explorer application in C++ that interfaces with the Linux operating system to manage files and directories.  <b>Day-wise Tasks:</b> <b>Day 1:</b> Design the application structure and setup the development environment. Start with basic file operations like listing files in a directory. <b>Day 2:</b> Implement file and directory navigation features. Enable the user to move through directories. <b>Day 3:</b> Add file manipulation capabilities (copy, move, delete, create). <b>Day 4:</b> Implement file search functionality within the file explorer. <b>Day 5:</b> Add file permission management features.	<b>Custom Shell Implementation</b>  <b>Objective:</b> Build a simple shell in C++ that can execute commands, manage processes, and handle redirection and piping.  <b>Day-wise Tasks:</b> <b>Day 1:</b> Plan the shell features and parse user input.  <b>Day 2:</b> Implement execution of basic commands through the shell. <b>Day 3:</b> Add support for process management (foreground, background processes). <b>Day 4:</b> Implement piping and redirection features. <b>Day 5:</b> Incorporate job control (listing jobs, bringing jobs to foreground/background).	<b>System Monitor Tool</b>  <b>Objective:</b> Create a system monitor tool in C++ that displays real-time information about system processes, memory usage, and CPU load, similar to the 'top' command.  <b>Day-wise Tasks:</b> <b>Day 1:</b> Design UI layout and gather system data using system calls.  <b>Day 2:</b> Display process list with CPU and memory usage. <b>Day 3:</b> Implement process sorting by CPU and memory usage. <b>Day 4:</b> Add functionality to kill processes. <b>Day 5:</b> Implement real-time update feature to refresh data every few seconds.	<b>Network File Sharing Server &amp; Client</b>  <b>Objective:</b> Develop a networked file sharing application with a server and client architecture, enabling file transfers over sockets.  <b>Day-wise Tasks:</b> <b>Day 1:</b> Setup server-client socket communication.  <b>Day 2:</b> Implement file listing and selection feature on the client side. <b>Day 3:</b> Enable file transfer from server to client. <b>Day 4:</b> Add file upload functionality from client to server. <b>Day 5:</b> Implement security features like authentication and encryption	<b>Bash Scripting Suite for System Maintenance</b>  <b>Objective:</b> Write a suite of Bash scripts to automate system maintenance tasks such as backup, system updates, and log monitoring.  <b>Day-wise Tasks:</b> <b>Day 1:</b> Write a script for automated system backups.  <b>Day 2:</b> Create a script to perform system updates and clean up. <b>Day 3:</b> Develop a log monitoring script to alert on certain conditions. <b>Day 4:</b> Combine scripts into a maintenance suite with a menu to execute them. <b>Day 5:</b> Test scripts and add error handling and logging functionalities.
